## RECTANGULAR and POLAR FORM of Complex Numbers.

1. imag

$z=1+i \quad$ and

$z=\sqrt{ } 2 \operatorname{cis}\left(45^{0}\right)$

The above are two ways to write the same complex number.
If we examine $z=\sqrt{ } 2 \boldsymbol{c i s}\left(45^{\circ}\right)$ we get $z=\sqrt{ } 2\left(\cos 45^{\circ}+i \sin 45^{\circ}\right)$

$$
\begin{aligned}
& =\sqrt{ } 2\left(\frac{1}{\sqrt{2}}+\frac{i}{\sqrt{2}}\right) \\
& =1+i
\end{aligned}
$$

Clearly the two forms of $z$ are equal.
2. Generally, consider the complex number represented by $\mathbf{P}$ below:
imag

The complex number represented by the point P on this Argand diagram can be written as:
$z=x+i y \quad$ but using basic trigonometry: $\quad x=r \cos \theta$ and $y=r \sin \theta$
so simply substituting we get $z=\boldsymbol{x}+\boldsymbol{i y}$ $=r \cos \theta+i r \sin \theta$
$=r(\cos \theta+i \sin \theta)$
Which we write in the short form $z=r \operatorname{cis}(\theta)$
IMPORTANT POINT: $\boldsymbol{r}$ is the LENGTH of OP so it is ALWAYS POSITIVE.

3

Here $z=3+0 i$ in rectangular form.
The length of $z=3$
also called the modulus of $z$ or $|z|$
The angle $z$ makes with the positive real axis is $0^{0}$
also called arg(z)
So in polar form $z=3 \operatorname{cis}\left(0^{0}\right)$

Here $z=0+3 i$ in rectangular form. The length of $z$ or $|z|=3$ (not $3 i$ )

The angle z makes with the positive real $\operatorname{axis}$ is $\arg (z)=90^{0}$

So in polar form $z=3$ cis $\left(90^{\circ}\right)$

Here $z=-3+0 i$ in rectangular form.
The length of $z$ or $|z|=4 \quad$ ( not -4)
The angle $z$ makes with the positive real axis is $\arg (z)=180^{0}$

So in polar form $z=4$ cis $\left(180^{\circ}\right)$

Here $z=0-2 i$ in rectangular form.
The length of $z$ or $|z|=2$ (not $-2 i$ )
The angle $z$ makes with the positive real axis is $\arg (z)=270^{\circ}$ or $-90^{\circ}$

So in polar form $z=2$ cis $\left(270^{\circ}\right)$

$$
\text { or } z=2 \operatorname{cis}\left(-90^{\circ}\right)
$$

7

Here $z=4+3 i$ in rectangular form.
The length of $z$ or $|z|=\sqrt{ }\left(4^{2}+3^{2}\right)=5$ by Pythagoras' theorem.

The angle $z$ makes with the positive real axis is $\tan ^{-1}(3 / 4) \approx 36.9^{0}$
so $\arg (z) \approx 36.9^{0}$
So in polar form $z=5$ cis (36.9 ${ }^{\circ}$ )

Here $z=-3+3 i$ in rectangular form.
The length of $z$ or $|z|=\sqrt{ }\left(3^{2}+3^{2}\right)=\sqrt{ } 18$ by Pythagoras' theorem.

The angle $z$ makes with the positive real axis is $\arg (z)=180-45=135^{\circ}$

So in polar form $z=\sqrt{ } 18$ cis $\left(135^{\circ}\right)$

Here $z=-4-4 i$ in rectangular form.
The length of $z$ or $|z|=\sqrt{ }\left(4^{2}+4^{2}\right)=\sqrt{ } 32$
The angle $z$ makes with the positive real axis is $\arg (z)=225^{\circ}$ or $-135^{\circ}$

So in polar form $z=\sqrt{ } 32$ cis $\left(225^{\circ}\right)$

$$
\text { or } z=\sqrt{ } 32 \operatorname{cis}\left(-135^{0}\right)
$$

Here $z=2-2 i$ in rectangular form.
The length of $z$ or $|z|=\sqrt{ } 8$
The angle $z$ makes with the positive real axis is $\arg (z)=315^{0}$ or $-45^{0}$

So in polar form $z=\sqrt{ } 8$ cis $\left(315^{\circ}\right)$

$$
\text { or } z=\sqrt{ } 8 \operatorname{cis}\left(-45^{\circ}\right)
$$

Here $z=-5+3 i$ in rectangular form. The length of $z$ or $|z|=\sqrt{ }(25+9)$ $=\sqrt{ } 34$
Angle $\alpha=\tan ^{-1}(3 / 5) \approx 31^{0}$
So $\theta$, the angle z makes with the positive real axis is $\arg (z)=180-31=149^{\circ}$

So in polar form $z=\sqrt{ } 34$ cis $\left(149^{\circ}\right)$

Here $z=-5-2 i$ in rectangular form.
The length of $z$ or $|z|=\sqrt{ }(25+4)=\sqrt{ } 29$
Angle $\alpha=\tan ^{-1}(2 / 5) \approx 21.8^{0}$
So $\theta$, the angle z makes with the positive real axis is $\arg (z)=180+201.8=201.8^{0}$

So in polar form $z=\sqrt{ } 29$ cis $\left(201.8^{0}\right)$

Here $z=1-3 i$ in rectangular form.
The length of $z$ or $|z|=\sqrt{ }(9+1)=\sqrt{ } 10$
Angle $\alpha=\tan ^{-1}(3 / 1) \approx 71.6^{0}$
So $\theta$, the angle $\boldsymbol{z}$ makes with the positive real axis is $\arg (z)=360-71.6=288.4^{0}$

So in polar form $z=\sqrt{ } 10$ cis (288.4 ${ }^{\circ}$ )

## SPECIAL CASES.

Look out for the "special triangles"

Here $z=-1+i \sqrt{ } 3$
in rectangular form.
The length of $z$ or $|z|$
$=\sqrt{ }(3+1)=\sqrt{ } 4=2$
$\alpha$ is clearly $60^{0}$ (see special triangle)
or $\tan ^{-1}(\sqrt{ } 3)=60^{0}$
So $\theta=180-60=120^{\circ}$
So in polar form $z=2$ cis $120^{\circ}$

Here $z=\sqrt{ } 3+i$ in rectangular form.
The length of $z$ or $|z|$
$=\sqrt{ }(3+1)=\sqrt{ } 4=2$
$\theta$ is clearly $30^{\circ}$ (see special triangle)

So in polar form $z=2 \operatorname{cis} 30^{0}$

## SPECIAL NOTE:

If we use a constant real number $\boldsymbol{p}$, such as $\boldsymbol{z}=\boldsymbol{p}+\boldsymbol{0 i}$ obviously $\boldsymbol{p}$ could be a positive number or a negative number.

This means that we cannot write $z$ in its polar form unless we know whether $\boldsymbol{p}$ is positive or negative.

If p is a positive real number then $\boldsymbol{z}$ looks like this:
and $\arg (z)$ would be $0^{0}$
so $z=p \operatorname{cis}\left(0^{0}\right)$

But if p is a negative real number then $z$ looks like this:
and $\boldsymbol{\operatorname { a r g }}(\boldsymbol{z})$ would be $0^{0}$
so $z=p \operatorname{cis}\left(180^{\circ}\right) \quad$ not $-p \operatorname{cis}\left(180^{\circ}\right)$

However, if we say $\boldsymbol{p}$ is any real number (positive or negative) then obviously we could say that even powers such as $\boldsymbol{p}^{2}$ or $\boldsymbol{p}^{4}$ or $\boldsymbol{p}^{6}$ etc would be POSITIVE and any odd powers such as $\boldsymbol{p}^{1}$ or $\boldsymbol{p}^{3}$ or $\boldsymbol{p}^{5}$ etc would be NEGATIVE.

Therefore if we want to express $\boldsymbol{z}=\boldsymbol{p}^{2}+\boldsymbol{0} \boldsymbol{i}$ in polar form we can be confident that
$\arg (z)$ would be $0^{0}$
so $z=p^{2} \operatorname{cis}\left(0^{0}\right)$

And if we want to express $\boldsymbol{z}=-\boldsymbol{p}^{2}+\boldsymbol{0 i}$ in polar form we can be confident that and $\arg (z)$ would be $180^{\circ}$
so $z=p^{2} \operatorname{cis}\left(180^{\circ}\right)$ obviously not $-p^{2} \operatorname{cis}\left(180^{\circ}\right)$

In the following examples we will assume that the variable $p$ is a POSITIVE REAL NUMBER.

## FURTHER SPECIAL CASES:

1. Suppose $z=\boldsymbol{p}+\boldsymbol{0 i}$

Clearly $|z|=p$ and $\arg (z)=0^{0}$

$$
\text { so } z=p \operatorname{cis}\left(0^{0}\right)
$$

2. Suppose $z=0+\boldsymbol{p} \boldsymbol{i}$

Clearly $|\boldsymbol{z}|=\boldsymbol{p} \quad$ (NOT pi) and $\arg (z)=90^{\circ}$

$$
\text { so } z=p \operatorname{cis}\left(90^{\circ}\right)
$$

3. Suppose $z=-\boldsymbol{p}+\boldsymbol{0} \boldsymbol{i}$

$$
\text { Clearly }|z|=\text { length }=p \quad(\text { NOT }-p)
$$

and $\arg (z)=180^{\circ}$

$$
\text { so } z=p \operatorname{cis}\left(180^{\circ}\right)
$$

4. Suppose $z=\boldsymbol{0}-\boldsymbol{p i}$

Clearly $|z|=$ length $=\boldsymbol{p}\left(\right.$ NOT $^{\prime}$-pi $)$
and $\arg (z)=270^{\circ}$ or $\mathbf{- 9 0} 0^{\circ}$
so $z=p \operatorname{cis}\left(270^{\circ}\right)$

5. Suppose $z=\boldsymbol{p}+\boldsymbol{p} \boldsymbol{i}$

Clearly $|z|=\sqrt{ }\left(p^{2}+p^{2}\right)=\sqrt{ } 2 p^{2}=p \sqrt{ } 2$ and $\arg (z)=45$

$$
\text { so } z=p \sqrt{ } 2 \operatorname{cis}\left(45^{0}\right)
$$

6. Suppose $z=-p+p i$

Clearly $|z|=\sqrt{ }\left(p^{2}+p^{2}\right)=\sqrt{ } 2 p^{2}=p \sqrt{ } 2$ and $\arg (z)=135^{\circ}$

$$
\operatorname{so} z=p \sqrt{ } 2 \operatorname{cis}\left(135^{0}\right)
$$

7. Suppose $z=\boldsymbol{p}-\boldsymbol{p i}$

Clearly $|z|=\sqrt{ }\left(p^{2}+p^{2}\right)=\sqrt{ } 2 p^{2}=p \sqrt{ } 2$ and $\arg (z)=225^{\circ}$

$$
\text { so } z=p \sqrt{ } 2 \operatorname{cis}\left(225^{0}\right)
$$

8*. Suppose $z=\boldsymbol{p}+(\boldsymbol{p} \sqrt{ } 3) \boldsymbol{i}$

$$
\begin{aligned}
\text { Clearly }|z|=r & =\sqrt{ }\left(p^{2}+3 p^{2}\right) \\
& =\sqrt{ } 4 p^{2} \\
& =2 p
\end{aligned}
$$

and $\arg (z)=\tan ^{-1}\left(\frac{p \sqrt{ } 3}{p}\right)=60^{\circ}$
so $z=2 p \operatorname{cis}\left(60^{0}\right)$

This triangle should be recognised as one of our special triangles.

Always look out for the "special triangles"
